Health Education and Communication

Community Health Nursing

Definition, principles, objectives and methods of health education, individual and group teaching, mass communication, audio-visual aids, behaviour change communication and evaluation of health education.

For educational purposes only.

CHAPTER 18 / COMMUNITY HEALTH NURSING 18. Health Education and Communication

1. Definition and aims

Health education is a planned learning process enabling individuals and communities to understand health information and develop skills for informed decisions. Health promotion is broader and includes policies, supportive environments and community action. Education does not guarantee behaviour change when practical barriers remain.

2. Principles of health education

Begin with assessed needs and existing knowledge; use credible and accurate information, appropriate language, meaningful examples and active participation. Proceed from known to unknown and simple to complex. Use repetition, reinforcement and demonstration; respect culture and individual autonomy; evaluate understanding and outcomes. Avoid fear-based or stigmatizing messages.

3. Methods of health education

Method	Examples	Strength
Individual	Counselling, home teaching	Tailored to individual needs
Group	Discussion, demonstration, role play	Peer learning and participation
Mass	Radio, posters, public messages, social media	Broad reach
Digital/interactive	Video, reminders, teleconsultation	Flexible access where available

Choose methods based on audience, literacy, language, accessibility, cost, objectives and opportunities for feedback.

4. Communication process and barriers

Sender -> encoding -> message -> channel -> receiver -> decoding -> feedback. Noise may interfere at any stage. Barriers include language, jargon, fear, low health literacy, hearing/vision impairment, misinformation, cultural differences and lack of privacy. Use simple language, qualified interpretation, accessible visual aids and teach-back.

5. Audio-visual aids

Aid	Use

Nurses Content
Downloaded from nursescontent.com

Poster/chart	Short messages and visual comparison
Flip chart/flashcards	Sequential small-group teaching
Models	Demonstration of anatomy or practical skills
Video/audio	Show procedures or illustrate events
Leaflet	Reinforcement and take-home reference

Keep materials readable, accurate, uncluttered and appropriate for language and literacy. Demonstrate practical skills with supervised return demonstration.

6. Behaviour change communication

IEC (information, education and communication) builds understanding; BCC (behaviour change communication) focuses on targeted behaviour; SBCC (social and behaviour change communication) also addresses social norms and environmental barriers. Use audience segmentation, locally relevant messages, trusted messengers, feedback and access to services. Example: improve handwashing by teaching technique, ensuring soap/water availability and reinforcing at key times.

7. Planning a health education session

1. 1. Assess audience needs and baseline knowledge.
2. 2. Establish SMART learning objectives.
3. 3. Select content, methods, materials and venue.
4. 4. Deliver in understandable language with questions and participation.
5. 5. Evaluate understanding through teach-back or demonstration.
6. 6. Follow up and assess behaviour and health outcomes.

Example objective: by session end, caregivers demonstrate correct preparation of ORS using the exact water volume on the packet. Do not use a generic volume for every formulation.

8. Evaluation and nursing role

Process measures include attendance, delivery quality and reach; immediate outcomes include knowledge and demonstration; later outcomes include behaviour and health effects. Use pre/post questions carefully, recognizing they do not prove long-term behaviour change. Nurses plan, teach, counsel, advocate for resources, correct misinformation respectfully and adapt education based on feedback.

9. Teaching methods and selection of media

Select teaching methods according to objectives, language, literacy, available time and group size. A demonstration is useful for a practical skill; discussion helps explore beliefs and barriers; individual counselling supports confidential decisions; mass communication raises awareness but cannot ensure individual understanding.

Method	Suitable use	Evaluation
Individual counselling	Medication or contraceptive decisions	Teach-back and follow-up
Group discussion	Exploring common barriers to healthy behaviour	Participation and agreed actions
Demonstration	Handwashing or other practical skills	Return demonstration
Posters and flipcharts	Visual reminders and structured teaching	Comprehension and recall
Radio or digital media	Reaching a larger population	Reach, feedback and behaviour indicators

10. Sample community health education session

Topic: Prevention of diarrhoeal disease. Audience: Caregivers of young children. Objective: By the end of a short session, caregivers will identify two safe-water practices, demonstrate handwashing and explain when an unwell child needs urgent assessment. Begin by asking about existing practices; demonstrate using local resources; invite questions and return demonstration. Arrange follow-up to identify barriers such as limited water or soap. In a practical ORS demonstration, use the specified volume of safe water stated on the packet rather than an assumed standard volume.

Evaluation levels

Immediate evaluation assesses comprehension and demonstration. Later evaluation assesses adoption of feasible behaviours and service use. Population outcomes require longer observation and consideration of other influences. Counting participants is an output, not proof of behaviour change.

11. Important Examination Questions

Long Answer Questions

1. 1. Define health education, explain principles, methods and steps of planning and evaluation.
2. 2. Describe how to plan, conduct and evaluate a community health education session.
3. 3. Compare individual, group and mass methods of health education.

Short Answer Questions

1. 1. IEC vs BCC
2. 2. AV aids
3. 3. barriers
4. 4. teach-back
5. 5. Return demonstration.
6. 6. Audio-visual aids.
7. 7. Teach-back.
8. 8. Behaviour change communication.

Very Short Answer Questions (with answers)

1. 1. IEC? Information, education and communication.
2. 2. Return demonstration? Learner performs taught skill.
3. 3. SMART? Specific, measurable, achievable, relevant, time-bound.
4. 4. Which method checks performance of a taught skill? - Return demonstration.
5. 5. What is feedback? - Information about whether the message was received and understood.

12. Quick Revision

- Use methods suited to audience and objectives.
- Health education is a two-way process.
- Evaluate understanding and practical behaviour separately.
- Address barriers, not merely knowledge gaps.

Conclusion

Effective health education is participatory and linked to practical opportunities for healthier behaviour.

Practice questions

Choose one best answer. The answer key and explanations follow the questions.

1. Which teaching method best confirms a learner can perform a practical health skill?

A. Handing out a leaflet without discussion
B. Counting posters displayed
C. Repeating instructions without observation
D. Supervised return demonstration

2. A community knows handwashing technique but lacks soap and water. What additional action supports behaviour change?

A. Improve access to soap and water
B. Repeat information without addressing supplies
C. Assume the community refuses prevention
D. Replace all practical teaching with slogans

3. Which approach is most appropriate when planning health education for an unfamiliar group?

A. Set objectives after delivering the session
B. Assess needs and existing knowledge first
C. Begin with the most technical information
D. Use the same method for every audience

Downloaded from nursescontent.com

4. A health session has good attendance but participants cannot describe the key prevention messages afterward. What should the nurse evaluate first?

A. Whether the language, teaching method and materials matched the audience

B. Whether attendance alone proves learning

C. Whether the audience should be excluded from future sessions

D. Whether the session contained enough technical terms

Nurses Content
Downloaded from nursescontent.com

Answer key and explanations

1. D - Supervised return demonstration

Return demonstration lets the nurse observe practical skill performance.

2. A - Improve access to soap and water

Behaviour change also depends on access to the resources needed to act.

3. B - Assess needs and existing knowledge first

Teaching should begin with assessed needs and existing knowledge.

4. A - Whether the language, teaching method and materials matched the audience

Attendance measures participation, not understanding. Adaptation to language, literacy and context, with a check of learning, improves health education.
