Epilepsy care Transition & follow-up

Adult Health Nursing | Transition & follow-up

For educational purposes only.

Fictional educational example. Individualize using verified patient findings, authorized treatment and current local protocols. No real patient record or observed outcome is claimed.

Clinical assessment

Subjective: Reports a missed dose and feeling tired after the event.

Objective findings and required checks: Recovering consciousness with ongoing observation; injury assessment is needed.

Physical examination and investigations: Document seizure description and duration; review glucose, electrolytes, medicine history and tests ordered by the team.

Supply actual values, units, timing and trends during supervised application. Do not invent missing clinical data.

Clinical focus and pathophysiology

Epilepsy care: Abnormal synchronized neuronal activity can cause recurrent seizures and temporary impaired awareness.

Medical / surgical management

Protect from injury, assess airway and recovery, and follow the individualized emergency and medication plan.

Illustrative drug and treatment study

Medicine / treatment	Purpose	Nursing checks

Medicine / treatment	Purpose	Nursing checks
Prescribed antiseizure medicine	Reduce recurrence	Verify regimen, adherence, interactions and adverse effects
prescribed rescue medicine	Treat qualifying prolonged or repeated seizures	Use only the authorized emergency protocol and monitoring.

Treatment examples are not a prescription. Verify the authorized product, dose, route, timing, contraindications and current local product information.

Nursing care plan

Nursing diagnoses use original clinical problem wording. They are not the licensed NANDA-I classification. Verify any formal label or code against your institution's licensed current edition; select actual or risk diagnoses only when supported by assessment.

Context task: Check unresolved risks, medicine reconciliation, practical support and follow-up before transition.

Set individualized measurable targets and an exact review time. Select actual or risk statements only when supported by assessment.

Assessment: subjective / objective	Nursing diagnosis: original problem wording	Short- and longer-term goals	Nursing interventions with rationale	Evaluation
Ask: Ask about warning symptoms, seizure history and prescribed treatment. Assess: Observe consciousness, seizure features, duration and recovery.	Vulnerability to injury during seizure activity. Possible factors: altered neurological activity or the underlying condition. Validate against the patient's assessment.	Short-term: Before any clinically approved transition: The patient is protected from avoidable injury and urgent prolonged activity is escalated. Longer-term: Before the clinically approved transition or agreed follow-up: Patient or caregiver explains the individualized seizure first-aid and follow-up plan.	1. Time and describe seizure activity and call for urgent help according to protocol. Rationale: Duration and recovery help identify an emergency. 2. Protect from nearby hazards, avoid restraint and place nothing in the mouth. Rationale: These actions reduce avoidable trauma and airway obstruction. 3. Support airway assessment, appropriate recovery positioning and prescribed emergency care. Rationale: Breathing and circulation may be compromised during or after a seizure. 4. Protect from injury, assess airway and recovery, and follow the individualized emergency and medication plan. Rationale: Abnormal synchronized neuronal activity can cause recurrent seizures and temporary impaired awareness. The condition-specific plan addresses the underlying problem while response is monitored.	Record the baseline and reassessed finding, the time and whether this goal is met, partly met or not met. If not met, reassess causes and revise or escalate. Do not record an unobserved improvement.

Assessment: subjective / objective	Nursing diagnosis: original problem wording	Short- and longer-term goals	Nursing interventions with rationale	Evaluation
Ask: Ask about falls, dizziness, vision and usual walking aids. Assess: Assess gait, medicines, cognition and environmental risks.	Vulnerability to a fall or accidental injury. Possible factors: unsteady mobility, dizziness or environmental hazards. Validate against the patient's assessment.	Short-term: Before any clinically approved transition: Transfers and essential activity occur without a fall during the care period. Longer-term: Before the clinically approved transition or agreed follow-up: Demonstrates safe use of assistance and identifies home hazards.	1. Individualize fall precautions and keep necessary items and the call bell accessible. Rationale: Accessible support reduces unsafe unassisted movement. 2. Supervise transfers according to assessed need and check footwear and aids. Rationale: Correct assistance and equipment improve stability. 3. Review reversible contributors with the team, including postural symptoms and medicines. Rationale: Addressing causes improves safety beyond environmental measures.	Record the baseline and reassessed finding, the time and whether this goal is met, partly met or not met. If not met, reassess causes and revise or escalate. Do not record an unobserved improvement.
Ask: Ask what worries the patient most and how they prefer to receive information. Assess: Observe distress, attention and ability to engage without making assumptions.	Emotional distress affecting participation in care. Possible factors: uncertainty, symptoms or unfamiliar treatment. Validate against the patient's assessment.	Short-term: Before any clinically approved transition: Identifies one immediate concern and participates in an agreed next step. Longer-term: Before the clinically approved transition or agreed follow-up: Describes helpful support and coping strategies before transition of care.	1. Listen without judgment and acknowledge specific concerns. Rationale: Feeling heard supports trust and therapeutic engagement. 2. Explain one step at a time and use teach-back with permission. Rationale: Manageable information reduces uncertainty and checks understanding. 3. Offer culturally appropriate support and refer when distress persists or safety concerns arise. Rationale: Additional support may be needed beyond bedside reassurance.	Record the baseline and reassessed finding, the time and whether this goal is met, partly met or not met. If not met, reassess causes and revise or escalate. Do not record an unobserved improvement.
Ask: Ask what the learner already knows and wants to understand. Assess:	Learning needs about the condition and care plan. Possible factors: new	Short-term: Before any clinically approved transition: Explains the most important immediate	1. Assess language, literacy, hearing, vision and preferred learning method. Rationale: Accessible teaching improves understanding. 2. Teach a few	Record the baseline and reassessed finding, the time

Health education and continuing care

Teach adherence, trigger management, safe first aid and individualized activity and driving advice under applicable rules.

Transition only after clinical readiness is confirmed. Reconcile medicines, check access and caregiver support, and document who will review the patient and when.

Urgent warning signs

A prolonged seizure, repeated seizures without recovery, injury or breathing difficulty is an emergency.

Evaluation and conclusion

For each goal, document met, partly met or not met using observed evidence and the review time. Reassess and revise if progress is inadequate. Individual assessment, prioritized care and coordinated review guide this topic.

Quick Revision

- Abnormal synchronized neuronal activity can cause recurrent seizures and temporary impaired awareness.

- Priority concerns: Vulnerability to injury during seizure activity; Vulnerability to a fall or accidental injury; Emotional distress affecting participation in care; Learning needs about the condition and care plan.

- A prolonged seizure, repeated seizures without recovery, injury or breathing difficulty is an emergency.

- Teach adherence, trigger management, safe first aid and individualized activity and driving advice under applicable rules.

Exam / viva: Which unresolved problem would delay transition, and what information must reach the next care team?
