Nutritional intake below current needs Acute mania

Mental Health Nursing | Focused diagnosis-based template

For educational purposes only.

Fictional educational example. Individualize using verified patient findings, authorized treatment and current local protocols. No real patient record or observed outcome is claimed.

Clinical assessment

Subjective: Little sleep, racing thoughts and feeling unusually energetic.

Objective findings and required checks: Pressured speech, distractibility and impulsive behaviour; safety and medical contributors need assessment.

Physical examination and investigations: Assess mental state, risk, sleep, intake, substances and medicine-related or medical causes.

Supply actual values, units, timing and trends during supervised application. Do not invent missing clinical data.

Clinical focus and pathophysiology

Acute mania: Mood elevation can impair judgment, sleep and the ability to meet basic needs.

Medical / surgical management

Use a calm consistent approach, reduce stimulation and support rest, hydration and prescribed treatment.

Illustrative drug and treatment study

Medicine / treatment	Purpose	Nursing checks
Prescribed mood stabilizer	Treat the assessed mood episode	Check drug-specific tests, interactions and toxicity
prescribed antipsychotic	Manage selected acute symptoms	Monitor sedation, movement effects and metabolic risks.

Treatment examples are not a prescription. Verify the authorized product, dose, route, timing, contraindications and current local product information.

Focused nursing-problem template

Nursing diagnoses use original clinical problem wording. They are not the licensed NANDA-I classification. Verify any formal label or code against your institution's licensed current edition; select actual or risk diagnoses only when supported by assessment.

Context task: Establish the immediate clinical priorities and verify the baseline before assuming a diagnosis.

Set individualized measurable targets and an exact review time. Select actual or risk statements only when supported by assessment.

Assessment: subjective / objective	Nursing diagnosis: original problem wording	Short- and longer-term goals	Nursing interventions with rationale	Evaluation
Ask: Ask about usual diet, recent intake, weight change and food access. Assess: Assess growth or weight trends, intake record and relevant nutritional findings.	Nutritional intake below current needs. Possible factors: poor appetite, increased requirements or feeding difficulty. Validate against the patient's assessment.	Short-term: At the next patient-specific reassessment: Tolerates the agreed nutrition plan without new complications. Longer-term: Before the clinically approved transition or agreed follow-up: Explains the individualized meal or feeding plan and follow-up arrangements.	1. Assess nutritional risk and confirm swallowing safety and any fasting order. Rationale: The appropriate feeding route depends on clinical safety. 2. Offer suitable small meals or prescribed feeds with dietitian input when indicated. Rationale: Individualized support improves intake and nutrient adequacy. 3. Monitor tolerance, weight or growth and metabolic findings where required. Rationale: Progress and complications guide adjustment of support. 4. Use a calm consistent approach, reduce stimulation and support rest, hydration and prescribed treatment. Rationale: Mood elevation can impair judgment, sleep and the ability to meet basic needs. The condition-specific plan addresses the underlying problem while response is monitored.	Record the baseline and reassessed finding, the time and whether this goal is met, partly met or not met. If not met, reassess causes and revise or escalate. Do not record an unobserved improvement.

Apply this template

Complete with verified data: assessment cues; supported actual problem or risk; measurable outcome and review time; selected authorized interventions and rationale; observed response and next action.

Subjective / objective cues: _____

Patient-specific target and review time: _____

Evaluation evidence and next action: _____

Health education and continuing care

Explain relapse signs, sleep routines, medicine monitoring and planned follow-up after stabilization.

Transition only after clinical readiness is confirmed. Reconcile medicines, check access and caregiver support, and document who will review the patient and when.

Urgent warning signs

Escalating aggression, exhaustion, severe dehydration, psychosis or inability to maintain safety needs urgent review.

Evaluation and conclusion

For each goal, document met, partly met or not met using observed evidence and the review time. Reassess and revise if progress is inadequate. Individual assessment, prioritized care and coordinated review guide this topic.

Quick Revision

- Mood elevation can impair judgment, sleep and the ability to meet basic needs.
- Priority concerns: Nutritional intake below current needs.
- Escalating aggression, exhaustion, severe dehydration, psychosis or inability to maintain safety needs urgent review.
- Explain relapse signs, sleep routines, medicine monitoring and planned follow-up after stabilization.

Exam / viva: What assessment evidence supports this problem, and what measurable result would demonstrate improvement?
