Movement limited by weakness, discomfort or restriction Assisted personal hygiene

Nursing Foundation | Focused diagnosis-based template

For educational purposes only.

Fictional educational example. Individualize using verified patient findings, authorized treatment and current local protocols. No real patient record or observed outcome is claimed.

Clinical assessment

Subjective: Wants to wash independently but tires quickly.

Objective findings and required checks: Needs partial help with bathing and dressing; skin is intact but folds need drying.

Physical examination and investigations: Assess task-specific ability, skin, fatigue and personal preferences.

Supply actual values, units, timing and trends during supervised application. Do not invent missing clinical data.

Clinical focus and pathophysiology

Assisted personal hygiene: Reduced stamina temporarily limits daily activities and can increase moisture-related skin problems.

Medical / surgical management

Offer a partial assisted wash, maintain privacy, check water temperature and encourage safe participation.

Illustrative drug and treatment study

Medicine / treatment	Purpose	Nursing checks
Emollient	Support dry skin when appropriate	Check allergy, suitability and slipping risk
barrier preparation	Protect moisture-exposed skin	Review skin response.

Treatment examples are not a prescription. Verify the authorized product, dose, route, timing, contraindications and current local product information.

Focused nursing-problem template

Nursing diagnoses use original clinical problem wording. They are not the licensed NANDA-I classification. Verify any formal label or code against your institution's licensed current edition; select actual or risk diagnoses only when supported by assessment.

Context task: Establish the immediate clinical priorities and verify the baseline before assuming a diagnosis.

Set individualized measurable targets and an exact review time. Select actual or risk statements only when supported by assessment.

Assessment: subjective / objective	Nursing diagnosis: original problem wording	Short- and longer-term goals	Nursing interventions with rationale	Evaluation
Ask: Ask about usual mobility, fatigue and help needed with activities. Assess: Assess strength, range, gait, balance and ordered movement restrictions.	Movement limited by weakness, discomfort or restriction. Possible factors: reduced strength, pain or prescribed movement limits. Validate against the patient's assessment.	Short-term: At the next patient-specific reassessment: Completes a jointly agreed movement task safely with appropriate assistance. Longer-term: Before the clinically approved transition or agreed follow-up: Demonstrates the home exercise or mobility plan before discharge.	1. Assess assistance needs and confirm prescribed restrictions before mobilization. Rationale: Matching support to ability prevents injury. 2. Plan graded movement, position changes and rest with physiotherapy where indicated. Rationale: Progressive activity supports function while limiting exhaustion. 3. Monitor tolerance and stop for new concerning symptoms. Rationale: Symptoms may indicate unsafe exertion or deterioration. 4. Offer a partial assisted wash, maintain privacy, check water temperature and encourage safe participation. Rationale: Reduced stamina temporarily limits daily activities and can increase moisture-related skin problems. The condition-specific plan addresses the underlying problem while response is monitored.	Record the baseline and reassessed finding, the time and whether this goal is met, partly met or not met. If not met, reassess causes and revise or escalate. Do not record an unobserved improvement.

Health education and continuing care

Teach safe hygiene aids, oral care, skin-fold drying and gradual independence.

Transition only after clinical readiness is confirmed. Reconcile medicines, check access and caregiver support, and document who will review the patient and when.

Urgent warning signs

New pressure damage, painful rash, fever or sudden functional decline needs review.

Evaluation and conclusion

For each goal, document met, partly met or not met using observed evidence and the review time. Reassess and revise if progress is inadequate. Individual assessment, prioritized care and coordinated review guide this topic.

Quick Revision

- Reduced stamina temporarily limits daily activities and can increase moisture-related skin problems.
- Priority concerns: Movement limited by weakness, discomfort or restriction.
- New pressure damage, painful rash, fever or sudden functional decline needs review.
- Teach safe hygiene aids, oral care, skin-fold drying and gradual independence.

Exam / viva: What assessment evidence supports this problem, and what measurable result would demonstrate improvement?
