Daily self-care needs exceed current ability Cerebral palsy supportive care

Child Health Nursing | Focused diagnosis-based template

For educational purposes only.

Fictional educational example. Individualize using verified patient findings, authorized treatment and current local protocols. No real patient record or observed outcome is claimed.

Clinical assessment

Subjective: Difficulty with movement, daily care and tiring during meals.

Objective findings and required checks: Motor impairment and support needs; assess communication, swallowing, skin and growth individually.

Physical examination and investigations: Review functional abilities, swallowing, nutrition, communication and rehabilitation assessments.

Supply actual values, units, timing and trends during supervised application. Do not invent missing clinical data.

Clinical focus and pathophysiology

Cerebral palsy supportive care: Early non-progressive brain injury affects motor control; associated needs vary widely.

Medical / surgical management

Provide individualized positioning, mobility aids, communication support and a safe feeding/self-care plan.

Illustrative drug and treatment study

Medicine / treatment	Purpose	Nursing checks
Prescribed antispasticity medicine	Manage selected troublesome muscle tone	Monitor sedation, weakness and functional effect
prescribed other therapy	Treat identified associated conditions	Verify the individualized specialist plan.

Treatment examples are not a prescription. Verify the authorized product, dose, route, timing, contraindications and current local product information.

Focused nursing-problem template

Nursing diagnoses use original clinical problem wording. They are not the licensed NANDA-I classification. Verify any formal label or code against your institution's licensed current edition; select actual or risk diagnoses only when supported by assessment.

Context task: Establish the immediate clinical priorities and verify the baseline before assuming a diagnosis.

Set individualized measurable targets and an exact review time. Select actual or risk statements only when supported by assessment.

Assessment: subjective / objective	Nursing diagnosis: original problem wording	Short- and longer-term goals	Nursing interventions with rationale	Evaluation
Ask: Ask which activities the person can do and where help is wanted. Assess: Assess personal-care tasks, cognition, mobility and available support.	Daily self-care needs exceed current ability. Possible factors: weakness, symptoms or reduced confidence. Validate against the patient's assessment.	Short-term: At the next patient-specific reassessment: Completes a chosen self-care activity with the agreed level of assistance. Longer-term: Before the clinically approved transition or agreed follow-up: Patient or caregiver demonstrates essential care skills and knows support options.	1. Assess ability task by task and respect preferences and privacy. Rationale: Specific assessment prevents unnecessary dependence. 2. Provide only the assistance required and use suitable aids. Rationale: Supported participation protects dignity and builds independence. 3. Teach caregivers with consent and confirm realistic support at home. Rationale: Continuity depends on available skills and resources. 4. Provide individualized positioning, mobility aids, communication support and a safe feeding/self-care plan. Rationale: Early non-progressive brain injury affects motor control; associated needs vary widely. The condition-specific plan addresses the underlying problem while response is monitored.	Record the baseline and reassessed finding, the time and whether this goal is met, partly met or not met. If not met, reassess causes and revise or escalate. Do not record an unobserved improvement.

Health education and continuing care

Teach safe handling, aids, feeding plan and accessible participation in school and daily activities.

Transition only after clinical readiness is confirmed. Reconcile medicines, check access and caregiver support, and document who will review the patient and when.

Urgent warning signs

New swallowing/respiratory difficulty, seizures, pain or sudden loss of function needs review rather than attribution to the diagnosis alone.

Evaluation and conclusion

For each goal, document met, partly met or not met using observed evidence and the review time. Reassess and revise if progress is inadequate. Individual assessment, prioritized care and coordinated review guide this topic.

Quick Revision

- Early non-progressive brain injury affects motor control; associated needs vary widely.

- Priority concerns: Daily self-care needs exceed current ability.

- New swallowing/respiratory difficulty, seizures, pain or sudden loss of function needs review rather than attribution to the diagnosis alone.

- Teach safe handling, aids, feeding plan and accessible participation in school and daily activities.

Exam / viva: What assessment evidence supports this problem, and what measurable result would demonstrate improvement?
