Vulnerability to infection or worsening infection Enteral feeding safety

Nursing Foundation | Focused diagnosis-based template

For educational purposes only.

Fictional educational example. Individualize using verified patient findings, authorized treatment and current local protocols. No real patient record or observed outcome is claimed.

Clinical assessment

Subjective: Feels dependent on the tube and asks how feeding safety is checked.

Objective findings and required checks: Tube and prescribed feeding plan present; placement confirmation and tolerance must be reviewed.

Physical examination and investigations: Verify approved placement confirmation before use, prescribed feed, fluid balance and metabolic monitoring.

Supply actual values, units, timing and trends during supervised application. Do not invent missing clinical data.

Clinical focus and pathophysiology

Enteral feeding safety: Enteral access supports nutrition when oral intake is insufficient or unsafe but carries aspiration and tube-related risks.

Medical / surgical management

Use the local tube-placement safety pathway, appropriate position, prescribed feeding schedule and tube-care plan.

Illustrative drug and treatment study

Medicine / treatment	Purpose	Nursing checks
Prescribed enteral formula	Provide individualized nutrition	Monitor tolerance and metabolic changes
tube-administered medicines	Deliver only suitable formulations	Confirm pharmacy advice and flushing instructions; do not crush unsuitable tablets.

Treatment examples are not a prescription. Verify the authorized product, dose, route, timing, contraindications and current local product information.

Focused nursing-problem template

Nursing diagnoses use original clinical problem wording. They are not the licensed NANDA-I classification. Verify any formal label or code against your institution's licensed current edition; select actual or risk diagnoses only when supported by assessment.

Context task: Establish the immediate clinical priorities and verify the baseline before assuming a diagnosis.

Set individualized measurable targets and an exact review time. Select actual or risk statements only when supported by assessment.

Assessment: subjective / objective	Nursing diagnosis: original problem wording	Short- and longer-term goals	Nursing interventions with rationale	Evaluation
Ask: Ask about exposure, wound symptoms and recent invasive devices. Assess: Inspect relevant sites and monitor systemic findings and investigation trends.	Vulnerability to infection or worsening infection. Possible factors: disrupted barriers, exposure or reduced host defence. Validate against the patient's assessment.	Short-term: At the next patient-specific reassessment: Aseptic care is maintained and any new signs of infection are escalated promptly. Longer-term: Before the clinically approved transition or agreed follow-up: Demonstrates relevant hygiene and explains the infection-prevention plan.	1. Use hand hygiene and risk-based standard or transmission precautions. Rationale: Interrupting transmission protects the patient, staff and other patients. 2. Review invasive device need with the team and maintain indicated aseptic care. Rationale: Unnecessary devices and barrier breaks increase infection exposure. 3. Monitor for systemic deterioration and administer prescribed antimicrobials on schedule. Rationale: Early escalation and timely indicated treatment reduce avoidable harm. 4. Use the local tube-placement safety pathway, appropriate position, prescribed feeding schedule and tube-care plan. Rationale: Enteral access supports nutrition when oral intake is insufficient or unsafe but carries aspiration and tube-related risks. The condition-specific plan addresses the underlying problem while response is monitored.	Record the baseline and reassessed finding, the time and whether this goal is met, partly met or not met. If not met, reassess causes and revise or escalate. Do not record an unobserved improvement.

Health education and continuing care

Teach tube handling only within the agreed caregiver plan and report displacement or intolerance immediately.

Transition only after clinical readiness is confirmed. Reconcile medicines, check access and caregiver support, and document who will review the patient and when.

Urgent warning signs

Stop use and urgently assess suspected displacement, respiratory distress, severe abdominal symptoms or aspiration.

Evaluation and conclusion

For each goal, document met, partly met or not met using observed evidence and the review time. Reassess and revise if progress is inadequate. Individual assessment, prioritized care and coordinated review guide this topic.

Quick Revision

- Enteral access supports nutrition when oral intake is insufficient or unsafe but carries aspiration and tube-related risks.

- Priority concerns: Vulnerability to infection or worsening infection.

- Stop use and urgently assess suspected displacement, respiratory distress, severe abdominal symptoms or aspiration.

- Teach tube handling only within the agreed caregiver plan and report displacement or intolerance immediately.

Exam / viva: What assessment evidence supports this problem, and what measurable result would demonstrate improvement?
