Fluid accumulation affecting comfort or function Heart failure

Adult Health Nursing | Focused diagnosis-based template

For educational purposes only.

Fictional educational example. Individualize using verified patient findings, authorized treatment and current local protocols. No real patient record or observed outcome is claimed.

Clinical assessment

Subjective: Breathlessness lying flat, leg swelling and recent weight gain.

Objective findings and required checks: Dependent edema and basal crackles; perfusion and renal status require monitoring.

Physical examination and investigations: Review ECG, renal function, electrolytes, chest imaging and echocardiography when ordered.

Supply actual values, units, timing and trends during supervised application. Do not invent missing clinical data.

Clinical focus and pathophysiology

Heart failure: Reduced cardiac function and neurohormonal responses can cause congestion and impaired organ perfusion.

Medical / surgical management

Monitor breathing, weight and fluid balance; implement prescribed medicines and individualized activity and fluid advice.

Illustrative drug and treatment study

Nurses Content
Downloaded from nursescontent.com

Medicine / treatment	Purpose	Nursing checks
Furosemide	Relieve prescribed congestion	Monitor urine, blood pressure, electrolytes and renal function
prescribed heart-failure therapy	Support long-term cardiac management	Verify the exact regimen and monitoring.

Treatment examples are not a prescription. Verify the authorized product, dose, route, timing, contraindications and current local product information.

Focused nursing-problem template

Nursing diagnoses use original clinical problem wording. They are not the licensed NANDA-I classification. Verify any formal label or code against your institution's licensed current edition; select actual or risk diagnoses only when supported by assessment.

Context task: Establish the immediate clinical priorities and verify the baseline before assuming a diagnosis.

Set individualized measurable targets and an exact review time. Select actual or risk statements only when supported by assessment.

Assessment: subjective / objective	Nursing diagnosis: original problem wording	Short- and longer-term goals	Nursing interventions with rationale	Evaluation
Ask: Ask about breathlessness, swelling and recent weight gain. Assess: Monitor edema, respiratory findings, weight, intake/output and electrolytes.	Fluid accumulation affecting comfort or function. Possible factors: impaired fluid handling or excess retention. Validate against the patient's assessment.	Short-term: At the next patient-specific reassessment: No progression of respiratory distress or edema occurs during the observation period. Longer-term: Before the clinically approved transition or agreed follow-up: Explains prescribed fluid, salt, weight-monitoring and follow-up instructions.	1. Use consistent weighing and intake/output records. Rationale: Comparable measurements help identify fluid trends. 2. Assess respiratory changes and elevate the head of the bed if tolerated. Rationale: Pulmonary fluid accumulation may compromise breathing. 3. Implement only prescribed fluid limits and diuretic treatment; monitor renal function and electrolytes. Rationale: Treatment must balance fluid removal with circulation and electrolyte safety. 4. Monitor breathing, weight and fluid balance; implement prescribed medicines and individualized activity and fluid advice. Rationale: Reduced cardiac function and neurohormonal responses can cause congestion and impaired organ perfusion. The condition-specific plan addresses the underlying problem while response is monitored.	Record the baseline and reassessed finding, the time and whether this goal is met, partly met or not met. If not met, reassess causes and revise or escalate. Do not record an unobserved improvement.

Health education and continuing care

Teach daily weight monitoring when advised, medicine adherence, salt/fluid instructions and early symptom reporting.

Transition only after clinical readiness is confirmed. Reconcile medicines, check access and caregiver support, and document who will review the patient and when.

Urgent warning signs

Acute severe breathlessness, chest pain, shock or reduced consciousness requires emergency review.

Evaluation and conclusion

For each goal, document met, partly met or not met using observed evidence and the review time. Reassess and revise if progress is inadequate. Individual assessment, prioritized care and coordinated review guide this topic.

Quick Revision

- Reduced cardiac function and neurohormonal responses can cause congestion and impaired organ perfusion.
- Priority concerns: Fluid accumulation affecting comfort or function.
- Acute severe breathlessness, chest pain, shock or reduced consciousness requires emergency review.
- Teach daily weight monitoring when advised, medicine adherence, salt/fluid instructions and early symptom reporting.

Exam / viva: What assessment evidence supports this problem, and what measurable result would demonstrate improvement?
