Reduced circulation to vulnerable tissues Hypertension follow-up

Adult Health Nursing | Focused diagnosis-based template

For educational purposes only.

Fictional educational example. Individualize using verified patient findings, authorized treatment and current local protocols. No real patient record or observed outcome is claimed.

Clinical assessment

Subjective: Usually feels well but sometimes misses tablets.

Objective findings and required checks: Repeated appropriately measured blood pressure is above the agreed target.

Physical examination and investigations: Review repeated readings, cardiovascular risk, renal function, electrolytes and indicated urine assessment.

Supply actual values, units, timing and trends during supervised application. Do not invent missing clinical data.

Clinical focus and pathophysiology

Hypertension follow-up: Persistent raised arterial pressure increases long-term vascular and organ risk.

Medical / surgical management

Confirm measurement technique, assess adherence and support prescribed medicines and realistic lifestyle changes.

Illustrative drug and treatment study

Medicine / treatment	Purpose	Nursing checks
Prescribed antihypertensive	Lower blood pressure in the individualized regimen	Monitor blood pressure, postural symptoms and drug-specific tests
medication reconciliation	Identify missed or interacting products	Discuss changes with the prescriber.

Treatment examples are not a prescription. Verify the authorized product, dose, route, timing, contraindications and current local product information.

Focused nursing-problem template

Nursing diagnoses use original clinical problem wording. They are not the licensed NANDA-I classification. Verify any formal label or code against your institution's licensed current edition; select actual or risk diagnoses only when supported by assessment.

Context task: Establish the immediate clinical priorities and verify the baseline before assuming a diagnosis.

Set individualized measurable targets and an exact review time. Select actual or risk statements only when supported by assessment.

Assessment: subjective / objective	Nursing diagnosis: original problem wording	Short- and longer-term goals	Nursing interventions with rationale	Evaluation
Ask: Ask about dizziness, chest discomfort, fatigue and cold extremities. Assess: Assess consciousness, pulse, blood pressure, capillary refill and urine trend.	Reduced circulation to vulnerable tissues. Possible factors: altered blood flow or cardiac function. Validate against the patient's assessment.	Short-term: At the next patient-specific reassessment: Circulation and consciousness remain within the clinician-agreed targets. Longer-term: Before the clinically approved transition or agreed follow-up: Describes symptoms that require immediate review and the agreed follow-up plan.	1. Trend perfusion findings and escalate new chest pain, shock or altered consciousness immediately. Rationale: Poor circulation can rapidly threaten organ function. 2. Balance activity and rest and maintain the ordered monitoring schedule. Rationale: Reducing demand supports recovery while trends guide treatment. 3. Administer prescribed therapy and monitor effects and adverse reactions. Rationale: Response monitoring supports safe correction of the underlying problem. 4. Confirm measurement technique, assess adherence and support prescribed medicines and realistic lifestyle changes. Rationale: Persistent raised arterial pressure increases long-term vascular and organ risk. The condition-specific plan addresses the underlying problem while response is monitored.	Record the baseline and reassessed finding, the time and whether this goal is met, partly met or not met. If not met, reassess causes and revise or escalate. Do not record an unobserved improvement.

Apply this template

Complete with verified data: assessment cues; supported actual problem or risk; measurable outcome and review time; selected authorized interventions and rationale; observed response and next action.

Subjective / objective cues: _____

Patient-specific target and review time: _____

Evaluation evidence and next action: _____

Health education and continuing care

Teach home measurement if advised, adherence, salt reduction, activity and follow-up.

Transition only after clinical readiness is confirmed. Reconcile medicines, check access and caregiver support, and document who will review the patient and when.

Urgent warning signs

Very high pressure with chest pain, neurological symptoms, severe breathlessness or visual change needs urgent assessment.

Evaluation and conclusion

For each goal, document met, partly met or not met using observed evidence and the review time. Reassess and revise if progress is inadequate. Individual assessment, prioritized care and coordinated review guide this topic.

Quick Revision

- Persistent raised arterial pressure increases long-term vascular and organ risk.

- Priority concerns: Reduced circulation to vulnerable tissues.

- Very high pressure with chest pain, neurological symptoms, severe breathlessness or visual change needs urgent assessment.

- Teach home measurement if advised, adherence, salt reduction, activity and follow-up.

Exam / viva: What assessment evidence supports this problem, and what measurable result would demonstrate improvement?
