Skin damage or vulnerability to pressure-related injury Obsessive-compulsive disorder

Mental Health Nursing | Focused diagnosis-based template

For educational purposes only.

Fictional educational example. Individualize using verified patient findings, authorized treatment and current local protocols. No real patient record or observed outcome is claimed.

Clinical assessment

Subjective: Repeated washing and intrusive thoughts interfere with study and daily life.

Objective findings and required checks: Time-consuming rituals with skin irritation; assess insight, function and mood.

Physical examination and investigations: Assess symptom impact, comorbidities, skin condition and safety using appropriate clinical tools.

Supply actual values, units, timing and trends during supervised application. Do not invent missing clinical data.

Clinical focus and pathophysiology

Obsessive-compulsive disorder: Intrusive thoughts and rituals can form a cycle of distress and temporary relief.

Medical / surgical management

Build trust and support specialist cognitive-behavioural treatment including exposure and response prevention when prescribed.

Illustrative drug and treatment study

Medicine / treatment	Purpose	Nursing checks
Prescribed SSRI	Treat OCD symptoms when indicated	Monitor adverse effects, adherence and response over the agreed review period
skin treatment when prescribed	Treat washing-related irritation	Assess skin integrity.

Treatment examples are not a prescription. Verify the authorized product, dose, route, timing, contraindications and current local product information.

Focused nursing-problem template

Nursing diagnoses use original clinical problem wording. They are not the licensed NANDA-I classification. Verify any formal label or code against your institution's licensed current edition; select actual or risk diagnoses only when supported by assessment.

Context task: Establish the immediate clinical priorities and verify the baseline before assuming a diagnosis.

Set individualized measurable targets and an exact review time. Select actual or risk statements only when supported by assessment.

Assessment: subjective / objective	Nursing diagnosis: original problem wording	Short- and longer-term goals	Nursing interventions with rationale	Evaluation
Ask: Ask about discomfort, usual mobility and ability to reposition. Assess: Inspect skin, pressure points, wound characteristics and moisture exposure.	Skin damage or vulnerability to pressure-related injury. Possible factors: pressure, moisture, impaired sensation or tissue injury. Validate against the patient's assessment.	Short-term: At the next patient-specific reassessment: Skin is protected and existing damage shows no avoidable deterioration. Longer-term: Before the clinically approved transition or agreed follow-up: Patient or caregiver demonstrates the individualized skin-protection plan.	1. Assess skin and pressure risk using the local tool and clinical judgment. Rationale: Risk identification guides targeted prevention. 2. Individualize repositioning, heel offloading and pressure redistribution. Rationale: Reducing sustained pressure and shear protects tissue perfusion. 3. Use appropriate wound care and moisture management; refer for nutrition or specialist advice when needed. Rationale: Healing requires local protection and support for underlying contributors. 4. Build trust and support specialist cognitive-behavioural treatment including exposure and response prevention when prescribed. Rationale: Intrusive thoughts and rituals can form a cycle of distress and temporary relief. The condition-specific plan addresses the underlying problem while response is monitored.	Record the baseline and reassessed finding, the time and whether this goal is met, partly met or not met. If not met, reassess causes and revise or escalate. Do not record an unobserved improvement.

Health education and continuing care

Explain the therapy plan and supportive family responses; avoid abrupt forced ritual prevention outside treatment.

Transition only after clinical readiness is confirmed. Reconcile medicines, check access and caregiver support, and document who will review the patient and when.

Urgent warning signs

Severe self-neglect, inability to eat or drink, suicidal thoughts or major skin infection needs urgent review.

Evaluation and conclusion

For each goal, document met, partly met or not met using observed evidence and the review time. Reassess and revise if progress is inadequate. Individual assessment, prioritized care and coordinated review guide this topic.

Quick Revision

- Intrusive thoughts and rituals can form a cycle of distress and temporary relief.
- Priority concerns: Skin damage or vulnerability to pressure-related injury.
- Severe self-neglect, inability to eat or drink, suicidal thoughts or major skin infection needs urgent review.
- Explain the therapy plan and supportive family responses; avoid abrupt forced ritual prevention outside treatment.

Exam / viva: What assessment evidence supports this problem, and what measurable result would demonstrate improvement?
