Breathing difficulty affecting oxygenation Pneumonia

Adult Health Nursing | Focused diagnosis-based template

For educational purposes only.

Fictional educational example. Individualize using verified patient findings, authorized treatment and current local protocols. No real patient record or observed outcome is claimed.

Clinical assessment

Subjective: Productive cough, fever, pleuritic discomfort and reduced appetite.

Objective findings and required checks: Fever, crackles and increased respiratory rate; oxygenation and sepsis risk need review.

Physical examination and investigations: Review chest imaging when ordered, blood count, oxygenation and indicated microbiology.

Supply actual values, units, timing and trends during supervised application. Do not invent missing clinical data.

Clinical focus and pathophysiology

Pneumonia: Infection and inflammation fill alveolar spaces and impair gas exchange.

Medical / surgical management

Assess severity, support oxygenation and hydration within the plan, and give indicated antimicrobials promptly.

Illustrative drug and treatment study

Medicine / treatment	Purpose	Nursing checks
Prescribed antibiotic	Treat the suspected or identified bacterial infection	Check allergy, timing, renal considerations and response
paracetamol	Relieve prescribed fever or pain symptoms	Check total exposure.

Treatment examples are not a prescription. Verify the authorized product, dose, route, timing, contraindications and current local product information.

Focused nursing-problem template

Nursing diagnoses use original clinical problem wording. They are not the licensed NANDA-I classification. Verify any formal label or code against your institution's licensed current edition; select actual or risk diagnoses only when supported by assessment.

Context task: Establish the immediate clinical priorities and verify the baseline before assuming a diagnosis.

Set individualized measurable targets and an exact review time. Select actual or risk statements only when supported by assessment.

Assessment: subjective / objective	Nursing diagnosis: original problem wording	Short- and longer-term goals	Nursing interventions with rationale	Evaluation
Ask: Ask about breathlessness, chest tightness and activity tolerance. Assess: Record respiratory rate, effort, SpO2 and mental state against the prescribed target.	Breathing difficulty affecting oxygenation. Possible factors: altered ventilation or gas exchange. Validate against the patient's assessment.	Short-term: At the next patient-specific reassessment: Breathing effort improves and oxygenation remains within the individualized target. Longer-term: Before the clinically approved transition or agreed follow-up: Explains the respiratory action plan and demonstrates the prescribed device technique.	1. Reassess work of breathing and response to each intervention. Rationale: Trend changes identify deterioration earlier than a single reading. 2. Position to ease breathing, cluster care and allow rest. Rationale: This can reduce respiratory demand and distress. 3. Give oxygen and respiratory medicines only according to the clinical prescription or emergency protocol. Rationale: Individualized treatment supports oxygenation without unsafe blanket targets. 4. Assess severity, support oxygenation and hydration within the plan, and give indicated antimicrobials promptly. Rationale: Infection and inflammation fill alveolar spaces and impair gas exchange. The condition-specific plan addresses the underlying problem while response is monitored.	Record the baseline and reassessed finding, the time and whether this goal is met, partly met or not met. If not met, reassess causes and revise or escalate. Do not record an unobserved improvement.

Health education and continuing care

Discuss treatment completion as prescribed, recovery pacing, respiratory hygiene and vaccination eligibility review.

Transition only after clinical readiness is confirmed. Reconcile medicines, check access and caregiver support, and document who will review the patient and when.

Urgent warning signs

Confusion, worsening hypoxia, shock or rapidly increasing respiratory effort requires urgent escalation.

Evaluation and conclusion

For each goal, document met, partly met or not met using observed evidence and the review time. Reassess and revise if progress is inadequate. Individual assessment, prioritized care and coordinated review guide this topic.

Quick Revision

- Infection and inflammation fill alveolar spaces and impair gas exchange.
- Priority concerns: Breathing difficulty affecting oxygenation.
- Confusion, worsening hypoxia, shock or rapidly increasing respiratory effort requires urgent escalation.
- Discuss treatment completion as prescribed, recovery pacing, respiratory hygiene and vaccination eligibility review.

Exam / viva: What assessment evidence supports this problem, and what measurable result would demonstrate improvement?
