Reduced circulation to vulnerable tissues Pre-eclampsia

Midwifery & O.G. Nursing | Focused diagnosis-based template

For educational purposes only.

Fictional educational example. Individualize using verified patient findings, authorized treatment and current local protocols. No real patient record or observed outcome is claimed.

Clinical assessment

Subjective: Persistent headache and visual disturbance.

Objective findings and required checks: Raised blood pressure with clinical assessment for proteinuria and organ involvement.

Physical examination and investigations: Review repeated blood pressure, urine protein, blood count/platelets, renal/liver tests and fetal assessment.

Supply actual values, units, timing and trends during supervised application. Do not invent missing clinical data.

Clinical focus and pathophysiology

Pre-eclampsia: Pregnancy-associated endothelial and placental dysfunction can affect multiple maternal organs and fetal well-being.

Medical / surgical management

Escalate promptly, monitor maternal/fetal status and prepare prescribed antihypertensive, seizure-prevention and birth-planning care.

Illustrative drug and treatment study

Nurses Content
Downloaded from nursescontent.com

Medicine / treatment	Purpose	Nursing checks
Prescribed antihypertensive	Control clinically significant hypertension	Monitor pressure and adverse effects
prescribed magnesium sulfate when indicated	Prevent or treat eclamptic seizures	Monitor respiration, reflexes and urine according to protocol.

Treatment examples are not a prescription. Verify the authorized product, dose, route, timing, contraindications and current local product information.

Focused nursing-problem template

Nursing diagnoses use original clinical problem wording. They are not the licensed NANDA-I classification. Verify any formal label or code against your institution's licensed current edition; select actual or risk diagnoses only when supported by assessment.

Context task: Establish the immediate clinical priorities and verify the baseline before assuming a diagnosis.

Set individualized measurable targets and an exact review time. Select actual or risk statements only when supported by assessment.

Assessment: subjective / objective	Nursing diagnosis: original problem wording	Short- and longer-term goals	Nursing interventions with rationale	Evaluation
Ask: Ask about dizziness, chest discomfort, fatigue and cold extremities. Assess: Assess consciousness, pulse, blood pressure, capillary refill and urine trend.	Reduced circulation to vulnerable tissues. Possible factors: altered blood flow or cardiac function. Validate against the patient's assessment.	Short-term: At the next patient-specific reassessment: Circulation and consciousness remain within the clinician-agreed targets. Longer-term: Before the clinically approved transition or agreed follow-up: Describes symptoms that require immediate review and the agreed follow-up plan.	1. Trend perfusion findings and escalate new chest pain, shock or altered consciousness immediately. Rationale: Poor circulation can rapidly threaten organ function. 2. Balance activity and rest and maintain the ordered monitoring schedule. Rationale: Reducing demand supports recovery while trends guide treatment. 3. Administer prescribed therapy and monitor effects and adverse reactions. Rationale: Response monitoring supports safe correction of the underlying problem. 4. Escalate promptly, monitor maternal/fetal status and prepare prescribed antihypertensive, seizure-prevention and birth-planning care. Rationale: Pregnancy-associated endothelial and placental dysfunction can affect multiple maternal organs and fetal well-being. The condition-specific plan addresses the underlying problem while response is monitored.	Record the baseline and reassessed finding, the time and whether this goal is met, partly met or not met. If not met, reassess causes and revise or escalate. Do not record an unobserved improvement.

Apply this template

Complete with verified data: assessment cues; supported actual problem or risk; measurable outcome and review time; selected authorized interventions and rationale; observed response and next action.

Subjective / objective cues: _____

Patient-specific target and review time: _____

Evaluation evidence and next action: _____

Health education and continuing care

Explain monitoring, medicine safety, fetal assessment and postpartum warning signs.

Transition only after clinical readiness is confirmed. Reconcile medicines, check access and caregiver support, and document who will review the patient and when.

Urgent warning signs

Seizure, severe headache/visual change, epigastric pain, breathing difficulty or reduced consciousness requires emergency maternity response.

Evaluation and conclusion

For each goal, document met, partly met or not met using observed evidence and the review time. Reassess and revise if progress is inadequate. Individual assessment, prioritized care and coordinated review guide this topic.

Quick Revision

- Pregnancy-associated endothelial and placental dysfunction can affect multiple maternal organs and fetal well-being.

- Priority concerns: Reduced circulation to vulnerable tissues.

- Seizure, severe headache/visual change, epigastric pain, breathing difficulty or reduced consciousness requires emergency maternity response.

- Explain monitoring, medicine safety, fetal assessment and postpartum warning signs.

Exam / viva: What assessment evidence supports this problem, and what measurable result would demonstrate improvement?
