Vulnerability to infection or worsening infection Preterm labor

Midwifery & O.G. Nursing | Focused diagnosis-based template

For educational purposes only.

Fictional educational example. Individualize using verified patient findings, authorized treatment and current local protocols. No real patient record or observed outcome is claimed.

Clinical assessment

Subjective: Regular tightening, pelvic pressure and concern about early birth.

Objective findings and required checks: Gestation, contractions, cervical/membrane status and maternal/fetal condition need assessment.

Physical examination and investigations: Review gestation, infection signs, membrane assessment and ordered fetal/cervical evaluation.

Supply actual values, units, timing and trends during supervised application. Do not invent missing clinical data.

Clinical focus and pathophysiology

Preterm labor: Early activation of labor pathways can lead to birth before fetal maturation is complete.

Medical / surgical management

Escalate to maternity care, monitor mother and fetus and prepare indicated transfer or prescribed gestation-specific treatment.

Illustrative drug and treatment study

Medicine / treatment	Purpose	Nursing checks
Prescribed antenatal corticosteroid when indicated	Support fetal maturation	Verify gestation, timing and glucose monitoring
prescribed tocolytic or magnesium where appropriate	Use only for a specific specialist indication	Monitor drug-specific safety.

Treatment examples are not a prescription. Verify the authorized product, dose, route, timing, contraindications and current local product information.

Focused nursing-problem template

Nursing diagnoses use original clinical problem wording. They are not the licensed NANDA-I classification. Verify any formal label or code against your institution's licensed current edition; select actual or risk diagnoses only when supported by assessment.

Context task: Establish the immediate clinical priorities and verify the baseline before assuming a diagnosis.

Set individualized measurable targets and an exact review time. Select actual or risk statements only when supported by assessment.

Assessment: subjective / objective	Nursing diagnosis: original problem wording	Short- and longer-term goals	Nursing interventions with rationale	Evaluation
Ask: Ask about exposure, wound symptoms and recent invasive devices. Assess: Inspect relevant sites and monitor systemic findings and investigation trends.	Vulnerability to infection or worsening infection. Possible factors: disrupted barriers, exposure or reduced host defence. Validate against the patient's assessment.	Short-term: At the next patient-specific reassessment: Aseptic care is maintained and any new signs of infection are escalated promptly. Longer-term: Before the clinically approved transition or agreed follow-up: Demonstrates relevant hygiene and explains the infection-prevention plan.	1. Use hand hygiene and risk-based standard or transmission precautions. Rationale: Interrupting transmission protects the patient, staff and other patients. 2. Review invasive device need with the team and maintain indicated aseptic care. Rationale: Unnecessary devices and barrier breaks increase infection exposure. 3. Monitor for systemic deterioration and administer prescribed antimicrobials on schedule. Rationale: Early escalation and timely indicated treatment reduce avoidable harm. 4. Escalate to maternity care, monitor mother and fetus and prepare indicated transfer or prescribed gestation-specific treatment. Rationale: Early activation of labor pathways can lead to birth before fetal maturation is complete. The condition-specific plan addresses the underlying problem while response is monitored.	Record the baseline and reassessed finding, the time and whether this goal is met, partly met or not met. If not met, reassess causes and revise or escalate. Do not record an unobserved improvement.

Apply this template

Complete with verified data: assessment cues; supported actual problem or risk; measurable outcome and review time; selected authorized interventions and rationale; observed response and next action.

Subjective / objective cues: _____

Patient-specific target and review time: _____

Evaluation evidence and next action: _____

Health education and continuing care

Explain the individualized plan, symptoms to report and neonatal-care preparation.

Transition only after clinical readiness is confirmed. Reconcile medicines, check access and caregiver support, and document who will review the patient and when.

Urgent warning signs

Bleeding, fever, fluid leakage with concerns, severe pain or fetal compromise needs urgent review.

Evaluation and conclusion

For each goal, document met, partly met or not met using observed evidence and the review time. Reassess and revise if progress is inadequate. Individual assessment, prioritized care and coordinated review guide this topic.

Quick Revision

- Early activation of labor pathways can lead to birth before fetal maturation is complete.
- Priority concerns: Vulnerability to infection or worsening infection.
- Bleeding, fever, fluid leakage with concerns, severe pain or fetal compromise needs urgent review.
- Explain the individualized plan, symptoms to report and neonatal-care preparation.

Exam / viva: What assessment evidence supports this problem, and what measurable result would demonstrate improvement?
