Difficulty clearing respiratory secretions Pulmonary tuberculosis

Adult Health Nursing | Focused diagnosis-based template

For educational purposes only.

Fictional educational example. Individualize using verified patient findings, authorized treatment and current local protocols. No real patient record or observed outcome is claimed.

Clinical assessment

Subjective: Persistent cough, weight loss, night sweats and treatment concerns.

Objective findings and required checks: Reduced weight and respiratory symptoms; transmission precautions are in place.

Physical examination and investigations: Review approved microbiological testing, imaging, treatment susceptibility information and baseline safety tests.

Supply actual values, units, timing and trends during supervised application. Do not invent missing clinical data.

Clinical focus and pathophysiology

Pulmonary tuberculosis: Mycobacterial infection causes pulmonary inflammation and may spread through airborne particles.

Medical / surgical management

Follow national TB and infection-control pathways; support treatment access, nutrition and confidential contact-related care.

Illustrative drug and treatment study

Medicine / treatment	Purpose	Nursing checks
Prescribed multidrug anti-TB regimen	Treat confirmed TB according to the national program	Monitor adherence, interactions and drug-specific adverse effects
no single-drug self-treatment	Avoid resistance-promoting treatment errors	Refer all changes to the treating team.

Treatment examples are not a prescription. Verify the authorized product, dose, route, timing, contraindications and current local product information.

Focused nursing-problem template

Nursing diagnoses use original clinical problem wording. They are not the licensed NANDA-I classification. Verify any formal label or code against your institution's licensed current edition; select actual or risk diagnoses only when supported by assessment.

Context task: Establish the immediate clinical priorities and verify the baseline before assuming a diagnosis.

Set individualized measurable targets and an exact review time. Select actual or risk statements only when supported by assessment.

Assessment: subjective / objective	Nursing diagnosis: original problem wording	Short- and longer-term goals	Nursing interventions with rationale	Evaluation
Ask: Report sputum, cough effectiveness and chest discomfort. Assess: Observe airway sounds, cough, secretions and ability to speak.	Difficulty clearing respiratory secretions. Possible factors: retained secretions and reduced cough effectiveness. Validate against the patient's assessment.	Short-term: At the next patient-specific reassessment: Airway remains patent and the patient demonstrates a more effective cough. Longer-term: Before the clinically approved transition or agreed follow-up: Demonstrates the agreed secretion-management technique before discharge.	1. Assess cough, breath sounds and secretion changes. Rationale: Changes can indicate obstruction or worsening infection. 2. Support a comfortable upright position and coached coughing when appropriate. Rationale: Position and an effective cough can help secretion clearance. 3. Provide prescribed inhaled treatment or suction only when indicated and within competence. Rationale: Targeted therapy supports airway clearance while limiting procedural harm. 4. Follow national TB and infection-control pathways; support treatment access, nutrition and confidential contact-related care. Rationale: Mycobacterial infection causes pulmonary inflammation and may spread through airborne particles. The condition-specific plan addresses the underlying problem while response is monitored.	Record the baseline and reassessed finding, the time and whether this goal is met, partly met or not met. If not met, reassess causes and revise or escalate. Do not record an unobserved improvement.

Health education and continuing care

Teach treatment completion, cough etiquette, ventilation, program support and follow-up without stigma.

Transition only after clinical readiness is confirmed. Reconcile medicines, check access and caregiver support, and document who will review the patient and when.

Urgent warning signs

Hemoptysis with instability, severe breathlessness, jaundice or major adverse reactions need prompt review.

Evaluation and conclusion

For each goal, document met, partly met or not met using observed evidence and the review time. Reassess and revise if progress is inadequate. Individual assessment, prioritized care and coordinated review guide this topic.

Quick Revision

- Mycobacterial infection causes pulmonary inflammation and may spread through airborne particles.
- Priority concerns: Difficulty clearing respiratory secretions.
- Hemoptysis with instability, severe breathlessness, jaundice or major adverse reactions need prompt review.
- Teach treatment completion, cough etiquette, ventilation, program support and follow-up without stigma.

Exam / viva: What assessment evidence supports this problem, and what measurable result would demonstrate improvement?
